

Included in this lesson is:

What is Artificial Intelligence (AI)?

What will this lesson teach you?

How to get started.

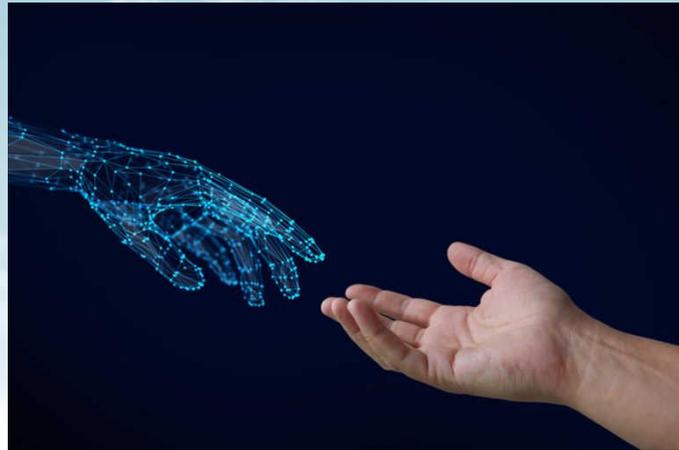

Step by step guide to change the code

What does my script mean?

What is Artificial Intelligence?

Making computers 'smart'

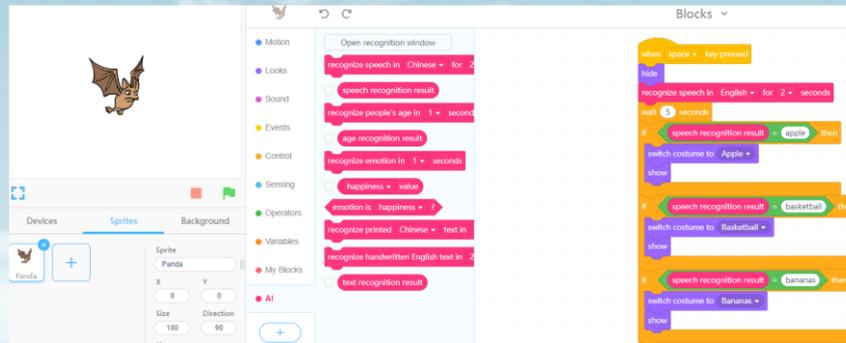

Programming machines to perform tasks like humans

This lesson will teach you to:

integrate AI into block based programming

teach the program word recognition using your voice

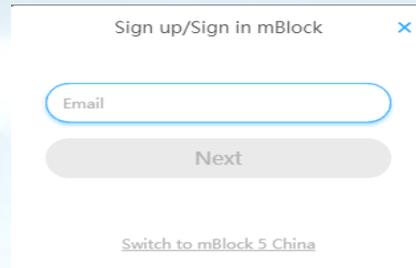

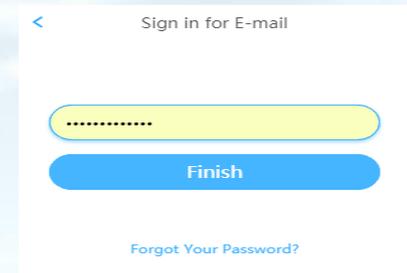

edit an existing program

How to get started

Copy & paste the link below into your browser:
<http://ide.makeblock.com>

Sign into mBlock using one of the temporary emails on the next slide

A screenshot of a mobile app interface titled "Sign up/Sign in mBlock". It features a white background with a blue border. At the top left is a small white bird icon. Below the title is a blue-outlined text input field labeled "Email". Underneath the input field is a grey button labeled "Next". At the bottom, there is a link that says "Switch to mBlock 5 China".A screenshot of a mobile app interface titled "Sign in for E-mail". It features a white background with a blue border. At the top left is a back arrow icon. Below the title is a yellow-outlined text input field containing a series of dots. Underneath the input field is a blue button labeled "Finish". At the bottom, there is a link that says "Forgot Your Password?".

Getting started

Choose example programs from the drop down menu

Ensure that AI is selected and click on the words recognition program

This code is generated automatically

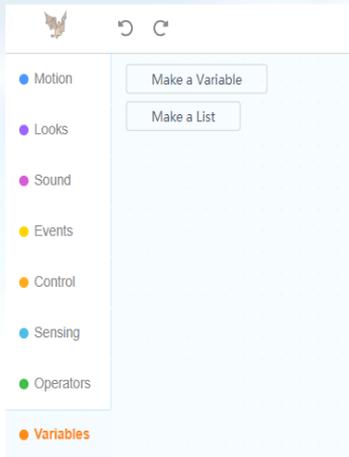

Creating a variable

Now you can begin editing the program...

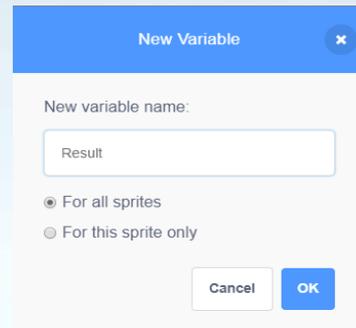

Later, we want to see what the computer recognises when you speak to it.

To do this, we need to create a 'result variable' and set the result to speech recognition.

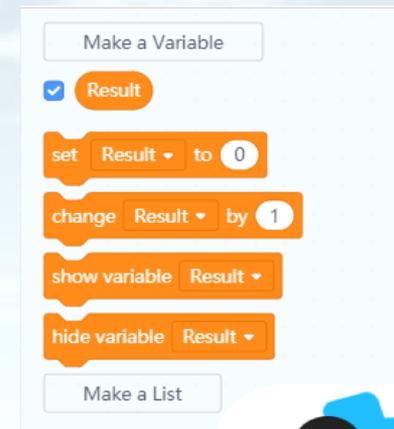

Select variables
from the toolbar
(orange)
Click on 'Make a
variable'

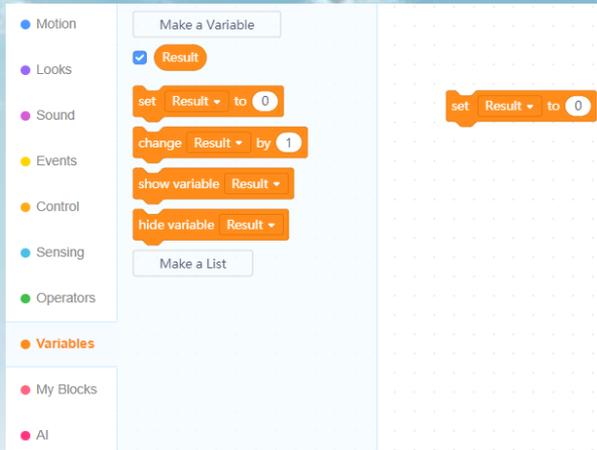

Name the new
variable result
and click OK

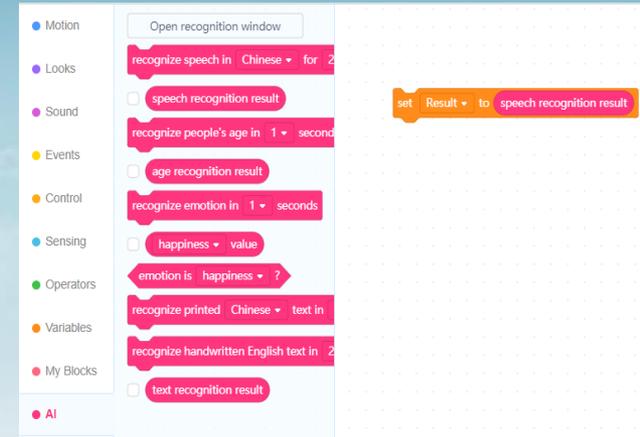

The result variable
is ready to use

Drag a 'set result to 0' block into the screen

Choose the AI tab from the toolbar and drag the 'speech recognition result' block inside the circle to replace the 0.

Drop the new variable block between

recognize handwritten English text in 2 seconds

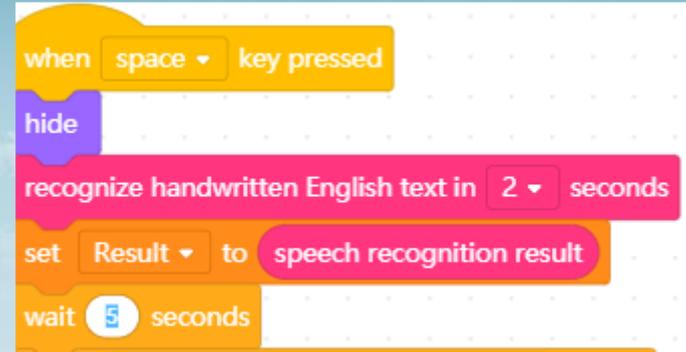

and

wait 5 seconds

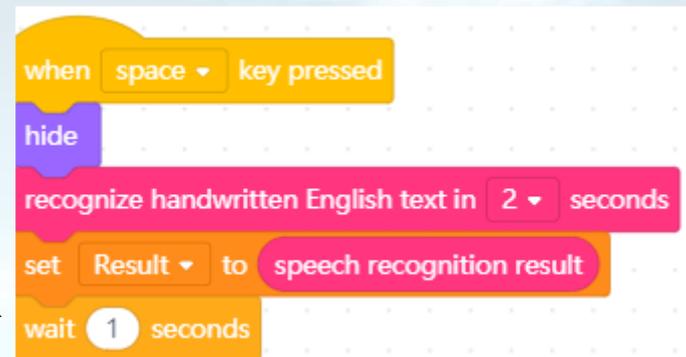

Editing the wait time

Since we are editing the program to recognise speech in place of written text, the wait time can be shortened

```
when space key pressed
hide
recognize handwritten English text in 2 seconds
set Result to speech recognition result
wait 5 seconds
```

Insert the cursor inside the circle of the 'wait 5 seconds block'
Type 1 in place of 5

```
when space key pressed
hide
recognize handwritten English text in 2 seconds
set Result to speech recognition result
wait 1 seconds
```

Deleting a block

The 'recognize handwritten English in 2 seconds' block is no longer needed for this program

First drag all blocks underneath this block away from it

Drag 'the recognize handwritten English in 2 seconds' block to the toolbar. When a trash can appears, you can drop it

```
when space key pressed
hide
recognize handwritten English text in 2 seconds

set Result to speech recognition result
wait 1 seconds
if text recognition result = apple then
switch costume to Apple
show
if text recognition result = basketball then
switch costume to Basketball
show
if text recognition result = bananas then
switch costume to Bananas
show
if text recognition result = butterfly then
switch costume to Butterfly
show
if text recognition result = bat then
switch costume to Bat
show
```

```
Open recognition window
recognize speech in Chinese for 2 seconds
speech recognition result
recognize people's age in 1 second
age recognition result
recognize emotion in 1 seconds
happiness value
emotion is happiness ?
recognize printed Chinese text in
recognize handwritten English text in 2 seconds
text recognition result

when space key pressed
hide
wait 5 seconds
if text recognition result = apple then
switch costume to Apple
show
if text recognition result = basketball then
switch costume to Basketball
show
if text recognition result = bananas then
switch costume to Bananas
show
```

Adding a new block

Now it's time to add the speech recognition block
This block can be found in the AI tab (pink)

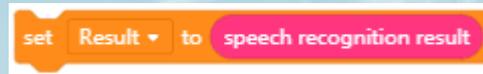

Drag and drop

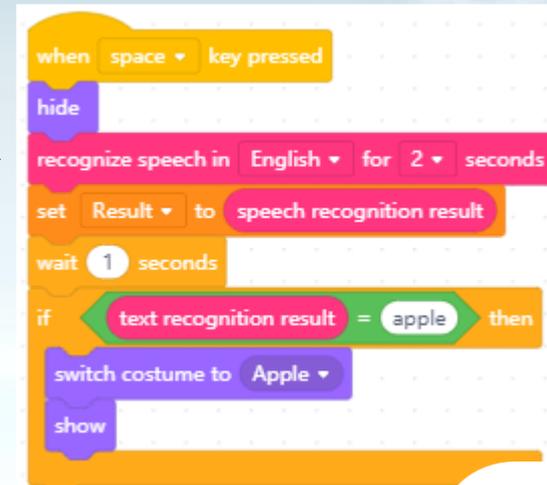

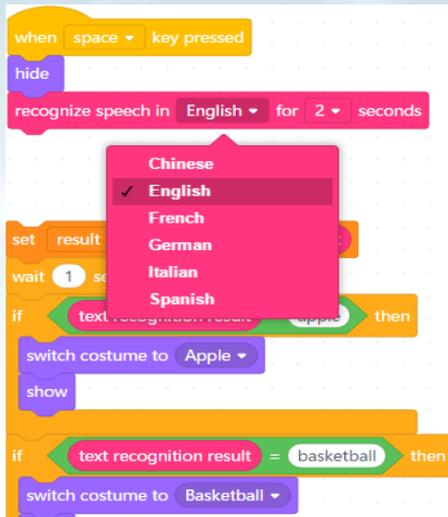

between

and

Use the drop down menu to
change the language to English

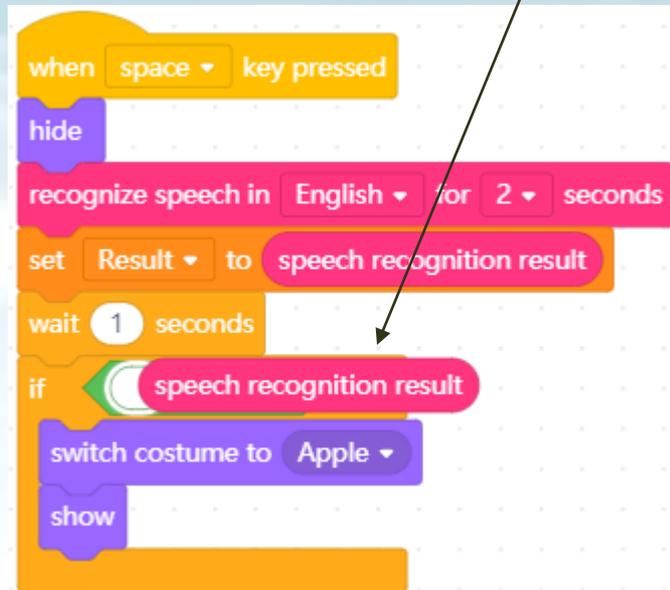

Replacing blocks

Now it's time to replace all 5 remaining  blocks with  blocks

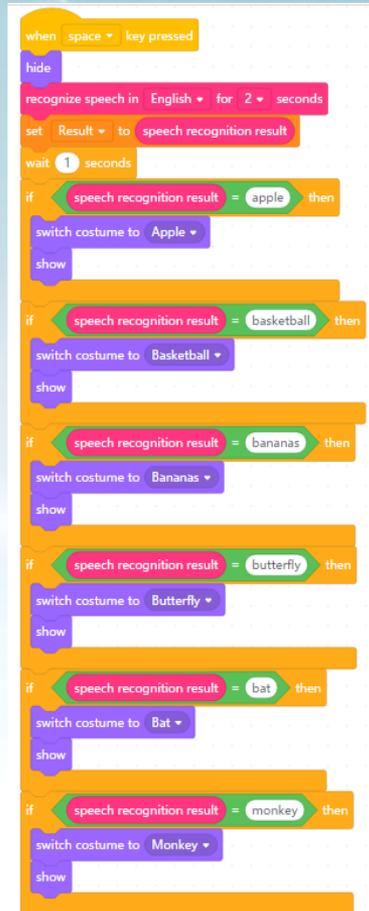

Delete all 'text recognition result' blocks by dragging them to the toolbar and dropping them when the trash can appears.

Drag 'speech recognition result' blocks into each of the 5 empty spaces

New script

Now your program has been successfully edited and you have created a new script that looks like this:

What does the script mean?

When space is pressed:
you will see only a blank screen
you have one second to say one of the 5 words
you will see in the corner of the screen what the computer has heard
the program will wait one second
if the computer hears apple
then an apple will appear on the screen
if the computer hears basketball
then a basketball will appear on the screen
if the computer hears bananas
then bananas will appear on the screen
if the computer hears bat
then a bat will appear on the screen
if the computer hears monkey then a monkey will appear on the screen

Time to play

Press 'space' and say the word 'apple' clearly

Result **Apple**

The result shows the computer heard the word 'apple'

Success! You see an apple!

Result **Apple**

Result **Awful**

The result shows the computer heard the word 'awful'

Try again! You only see a blank screen

Result **Awful**

Congratulations, you have successfully completed an AI project! You programmed a script to recognize speech!

**Why not try making your own AI project?
We even have an AI robot**

Artificial Intelligence and programming

Brought to you by:
